

# HOW TO RUN PROJECT

1. Open Anaconda prompt and create new environment

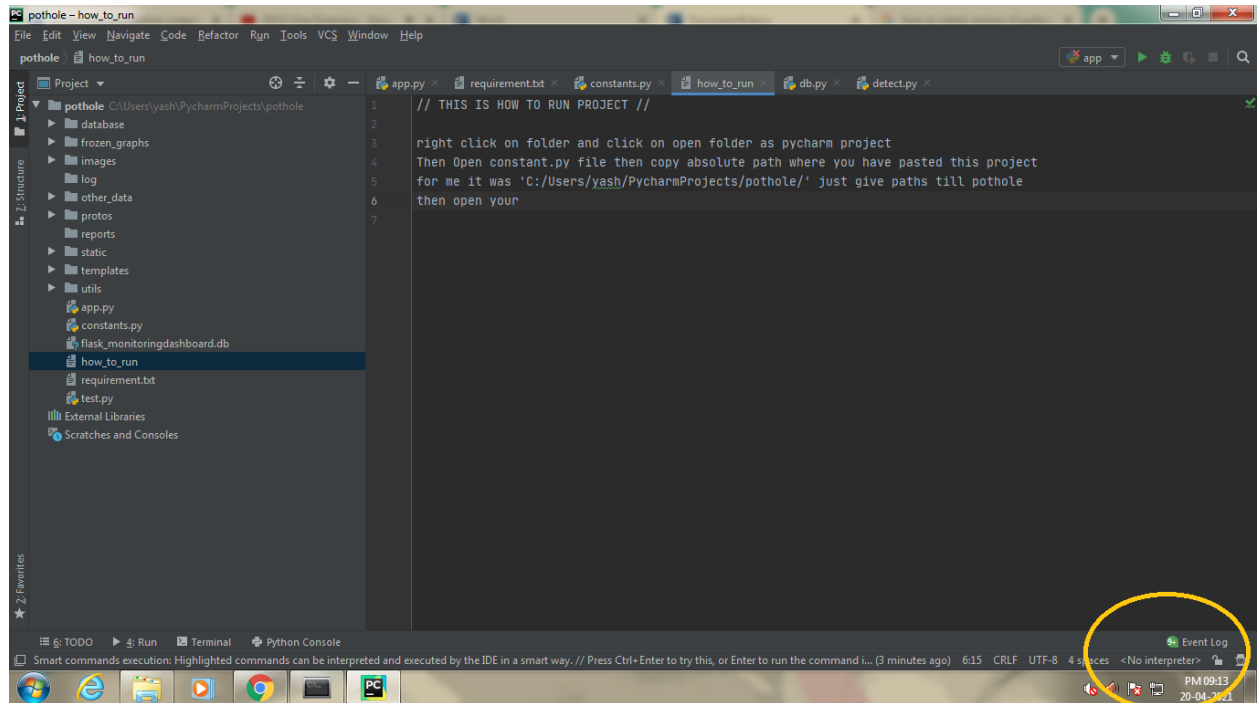

“ conda create -n pothole\_detection python==3.7 ”

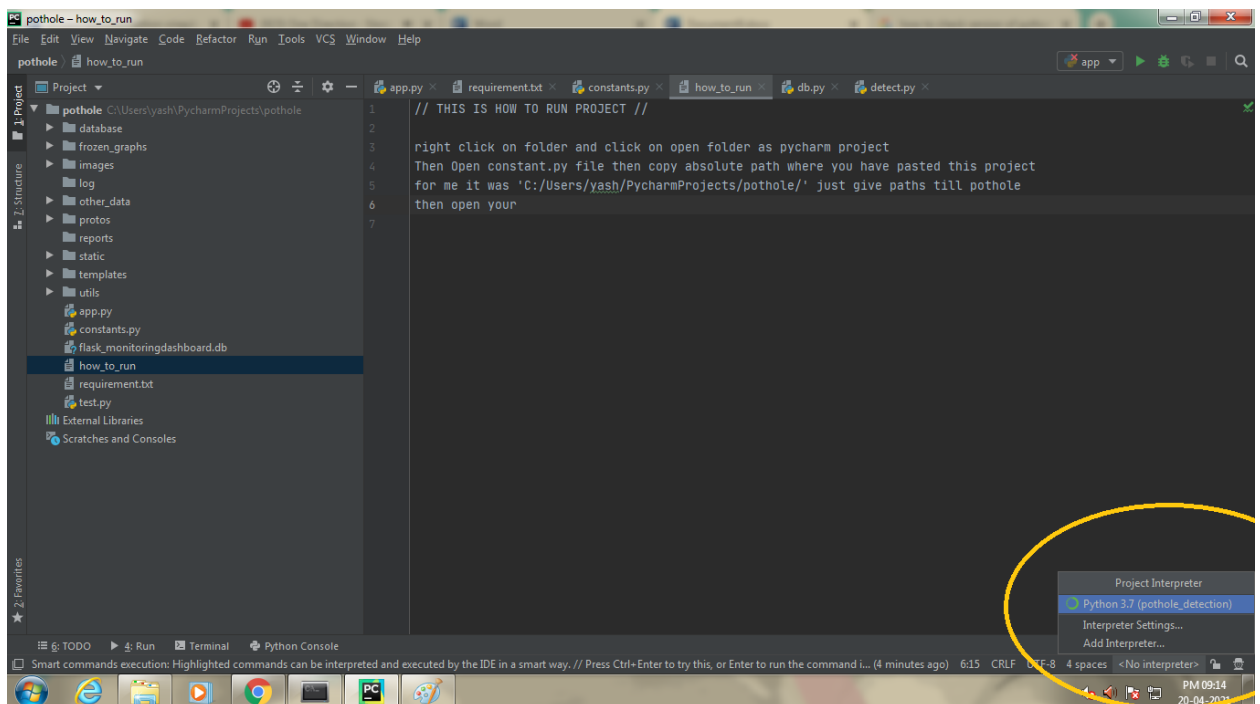

2. Then Go to folder and right click on open folder as pycharm project

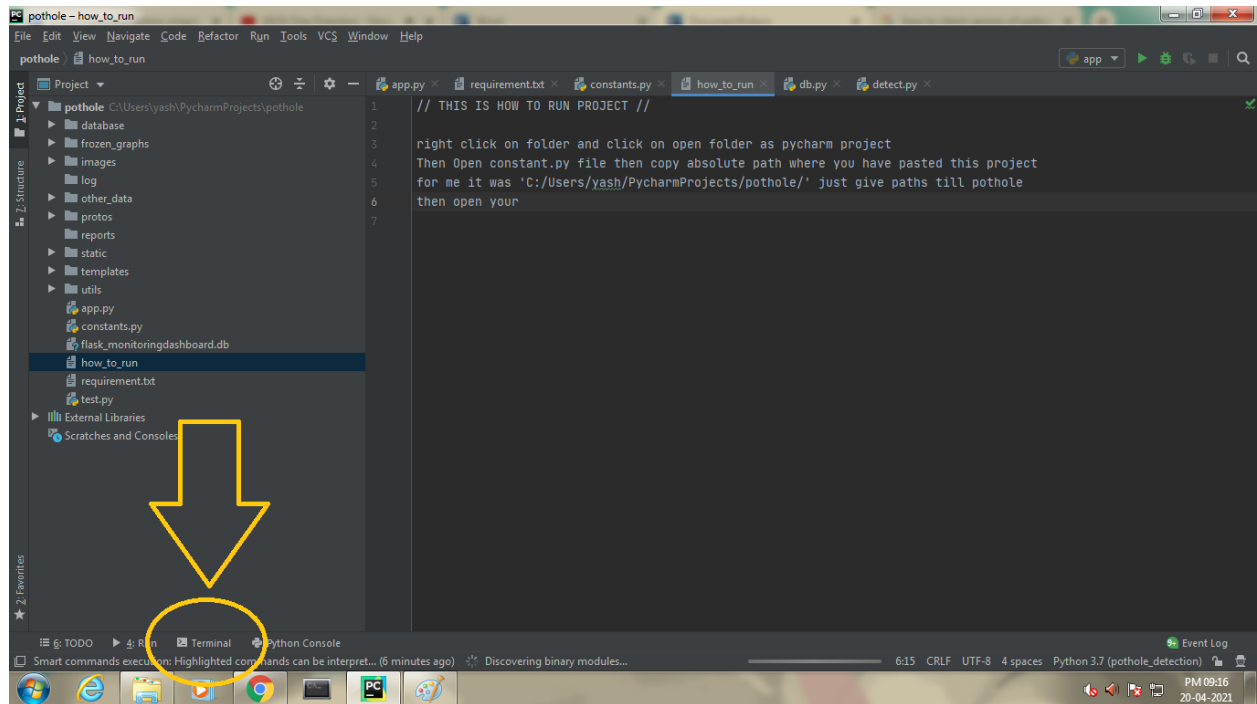

3. Then after it open pycharm go to no interpreter option in right side down corner

4. And select the interpreter you had created and click on that

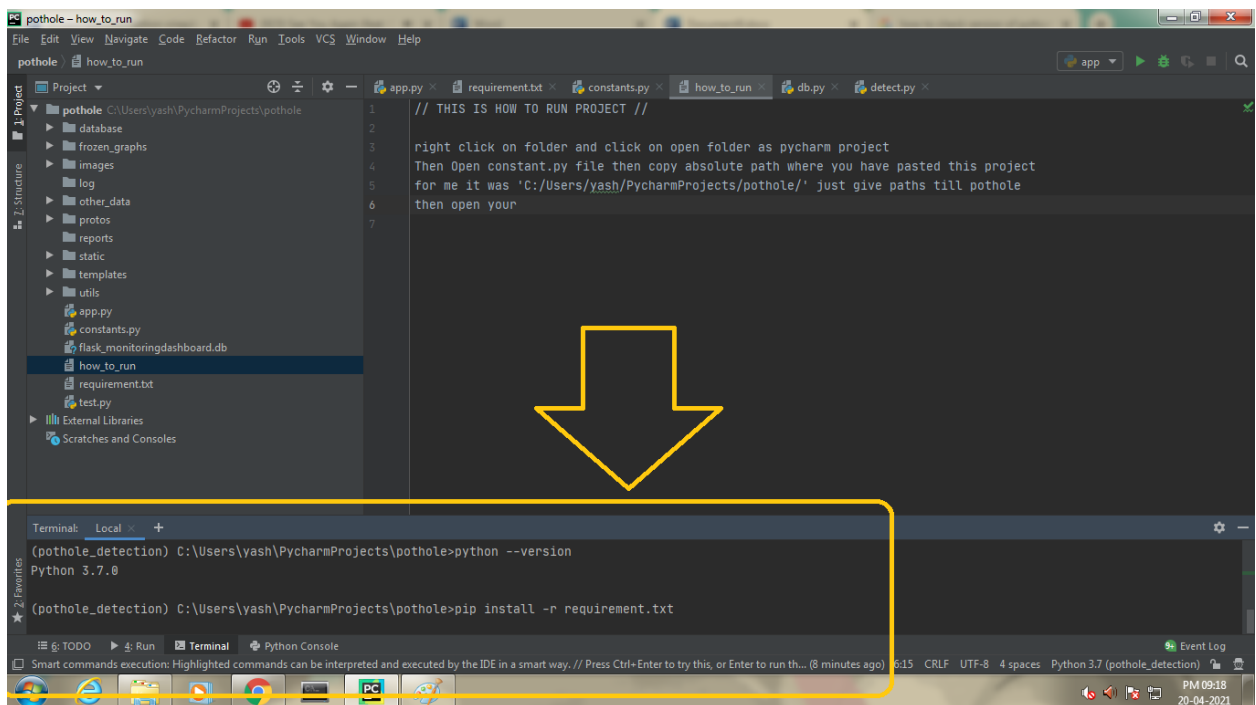

## 5. Now click on Terminal

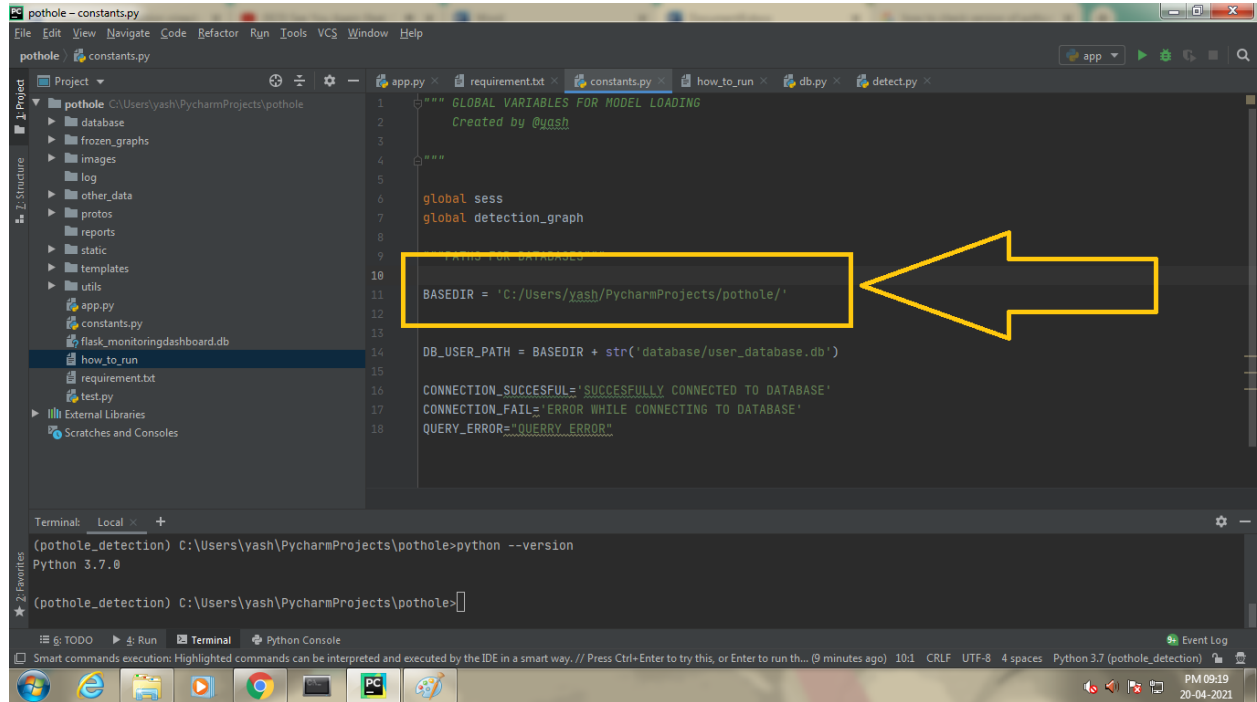

And type

Pip install -r requirement.txt

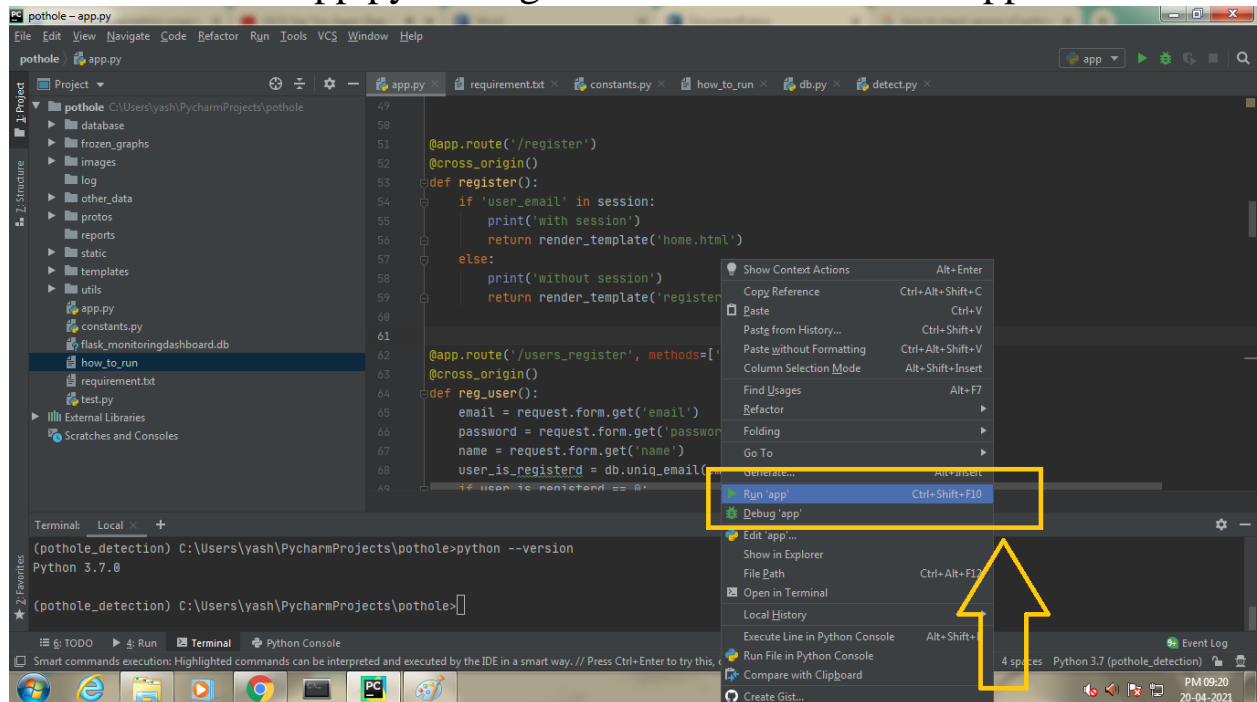

It will automatically install packages

6. Now go to constant.py file and change BASEDIR path to your absolute path

7. Now Go to app.py and right click and click on run app

8. Now web app will be loaded
